

**PASSAGE #9**Soil

---

Everyone needs to eat healthy food, but good food can't grow without the right soil. Healthy soil consists of a mixture of decaying material, water, minerals, and organisms, like bugs. However, not every region has the right soil for all types of crops. Different foods and plants require different combinations and ratios of these core components of soil. For example, lettuce grows well in wet soil whereas carrots grow well in dry soil.

**MISSING SENTENCE**

So, everyone can have access to many types of grains, vegetables, and fruits.
